

New Products - Flutiform

Flutiform (**fluticasone propionate and eformoterol fumarate dehydrate**) is a combination product for asthma. Fluticasone propionate is a synthetic trifluorinated glucocorticoid with potent anti-inflammatory activity in the lungs when administered by inhalation. Eformoterol fumarate is a potent long-acting, selective β_2 -adrenergic receptor agonist. As with other combinations of inhaled corticosteroids and long-acting β_2 -adrenergic agonists, the additive effect produces a reduction in the exacerbation of asthma. Flutiform inhaler is indicated for the regular maintenance treatment of asthma where the use of a combination product (an inhaled corticosteroid and a long-acting β_2 -agonist) is appropriate. Flutiform is available as a pressurised inhalation in 3 different strengths, each containing 120 actuations.

This list is a summary of only some of the changes that have occurred over the last month. Before prescribing, always refer to the full product information.
